     The addition of amines such as ethylenediamine, diethylenetriamine and
     melamine in the course of carbonation of basic calcium carbonate promoted
    the formation of a disk-like calcium carbonate which is vaterite and 1-1.5
     \mu m in diameter and 0.1-0.2 \mu m in thickness. On the other hand,
     dicarboxylic acids, carboxylic chelate compds., and amino acids
     promoted the formation of cubic or spindle-like calcite.
     Diethylenetriamine which was adsorbed on the surface of calcium carbonate
     plays an important role in the formation of disk-like calcium carbonate.

of. C.A. 53, 244i. Esters of H2NCH2CO2H (I) and MeNHCH2CO2H (II) react with phosphorylcyanamides to yield the corresponding phosphagene esters (III) which upon hydrogenolysis yield 38% phosphocreatine (IV) and 43% phosphoglycocyamine (V). II (20 g.), 38.6 g. PhSO3H (VI), and 111 g. PhCH2OH (VII) heated 4 hrs. at 120-30° with the removal of H2O and VII, the residue cooled, digested with Et2O, and filtered, the residue dried (75 g.), treated again with 100 g. VII and 1.5 g. VI in the same fashion, and the crude product recrystd. (Me2CO-Et2O) yielded 74 g. benzenesulfonate (VIII) of MeNHCH2CO2CH2PH.HCI (IX.HCI), m. 106-8°. VIII (68 g.) in 150 cc. CHCl3 treated with cooling with 21 g. Et3N in portions, diluted with 850 cc. Et2O, and filtered, the filtrate treated with dry HCl, and the precipitate filtered off and dried over NaOH gave 36 g.

m. 178-9° (decomposition) (MeOH-Et2O). H2NC(:NH)CH2CO2H (X) (5.85 g.), 8.7 g. VI, and 25 g. VII heated 4 hrs. and diluted with Et2O gave 13.8 g. benzenesulfonate of H2NC(:NH)CH2CO2CH2Ph, m. 169-70° (EtOH-Et2O or H2O). H2NCH2CO2Et.HCl (0.70 g.) treated with Et3N and then with 1.6 g. (PhO)2P(O)N:C(SMe)NH2 (XI) and 0.65 g. HgO in EtOH at 60° with agitation, filtered, concentrated, dissolved in PhMe, refluxed 10 min., and evaporated in vacuo, the residue dissolved in C6H6 and repptd. with petr. ether gave 1.02 g. (PhO)2P(O)N:C(NH2)NHCH2CO2Et (XII), m. 122-3° (aqueous EtOH and C6H6-cyclohexane). XI (12.8 g.) in 150 cc. EtOH agitated 2 hrs. at 60° with 4.8 g. HgO and 2.4 g. Na2CO3 in 10 cc. H2O, refluxed 2 hrs., kept overnight, filtered, treated with 4.6 g. H2NCH2CO2Me.HCl (XIII), and evaporated in vacuo, the residue refluxed 20 min. with PhMe and evaporated in vacuo, and the crystalline residue digested with

and dried yielded 11.7 g. Me ester analog of XII, m. 125-6° (C6H6-cyclohexane). (p-O2NC6H4O)2P(O)NNaCN (XIV) (1.0 g.), 30 cc. iso-BuOH, and 0.3 g. XIII refluxed 20 min. and evaporated in vacuo, the oily residue digested with H2O, the oily layer dissolved in hot EtOH, and the solution cooled gave 0.80 g. (p-O2NC6H4O)2P(O)N:C(NH2)NHCH2CO2Me (XV), m.

H20

 \times

ith K

120-1° (aqueous EtOH). Et ester of II.HCl was converted similarly to (p-02NC6H40)2P(0)N:C(NH2)NMeCH2CO2Et, m. 72-3° (Me2CO-petr. ether). (PhO)2P(O)NNaCN (XVI) in EtOH treated with 8.2 g. H2NCH2CO2CH2Ph.HCl (XVII), the EtOH removed, the residue refluxed 20 min. with 40 cc. iso-BuOH, the solvent distilled in vacuo, the residue dissolved in EtOAc, and the solution washed, dried, and evaporated gave 10.2 g. PhCH2 ester analog (XVIII) of XII, m. 103-4° (C6H6-cyclohexane). XIV with 1.1 g. XVII in 40 cc. iso-BuOH yielded 2.1 g. PhCH2 ester analog of XV, m. 140° (aqueous EtOH). XI (6.4 g.), 2.5 g. HgO, 2.3 g. Et3N, 70 cc. EtOH, and 10 cc. H2O shaken 1 hr. at 60°, filtered, treated with fresh HgO, refluxed 0.5 hr., refrigerated, filtered, and evaporated in vacuo, the residue dissolved in 60 cc. iso-BuOH, the solution treated with 4.6 g. IX.HCl in 100 cc. hot iso-BuOH, the mixture refluxed 15 min., and evaporated, and the residue dissolved in C6H6, washed with H2O, and repptd. with cyclohexane gave 6.1 g. (PhO) 2P(O) N:C(NH2) BMeCH2CO2CH2Ph (XIX), m. 103° (aqueous MeOH). XI (12.8 g.) in 120 cc. EtOH, 5.0 g. HgO, and 3.6 g. guanidine carbonate in 20 cc. H2O shaken 1 hr. at 60°, refluxed 0.5 hr., kept overnight at 0°, and filtered, the filtrate evaporated in vacuo, the residual oil dissolved in Me2CO, and the solution diluted with Et2O to turbidity and cooled to 0° gave 11.6 g. guanidinium salt of XVI, n. 136° (EtOH-Et20). (p-02NC6H40)2P(0)N:C(SMe)NH2 (4.4 g.) in 90 cc. EtOH, 1.3 g. HgO, 0.6 g. Na2CO3, and 20 cc. H2O shaken 2 hrs. at 60°, treated with fresh HgO, refluxed, cooled, and filtered, the filtrate evaporated, and the residue dissolved in warm EtOH and diluted with Me2CO and Et2O yielded 3.82 g. XIV, m. 218° (decomposition). XVIII (4.4 g.) in MeOH hydrogenated over 5% Pd-C, filtered, and evaporated, and the residue dissolved in Me2CO and diluted with a little H2O yielded 3.25 g. (PhO) 2P(O) N:C(NH2) NHCH2CO2H (XX), m. 144° (aqueous EtOH). XIX (4.33 q.) hydrogenated in the usual manner yielded 3.28 g. (PhO) 2P(O) N:C(NH2) NMeCH2CO2H (XXI), m. 140-1° (aqueous MeOH). XXI (1.8 g.) in MeOH hydrogenated over PtO2, filtered, and evaporated in vacuo, the residue treated with Me2CO, the hygroscopic precipitate dissolved in a little H2O, digested with CaCO3, filtered, and diluted with EtOH, and the precipitate filtered off and dried over H2SO4 in vacuo yielded 1.0 g. Ca salt of IV; the solution digested with CaCO3 treated with CaCl2, basified weakly with NaOH, and diluted with EtOH also gave the Ca salt of IV, Rf 0.28 (6:3:1 PrOH-NH4OH-H2O); it showed upon titration with NaOH buffer maximum at pH 2.7 and 4.5. Hydrogenated XXI neutralized with NaOH and diluted with EtOH gave 47% Na salt of IV.4H2O, needles. XX (1.75 g.) in MeOH hydrogenated over PtO2 and filtered, the residue digested with H2O, and the aqueous extract diluted with Me2CO gave V, m. 150°; the filter residue from a similar run digested with 0.4 g. NaOH in 25 cc. H2O and filtered, and the filtrate diluted with EtOH gave 1.17 g. Na salt of V.3H2O. V dissolved in aqueous cyclohexylamine and diluted with Me2CO gave 90% cyclohexylamine $\operatorname{\boldsymbol{salt}}$ of $\widetilde{\operatorname{V}}$. The filter residue from a similar run digested with CaCO3, filtered, and diluted with EtOH gave the Ca salt of V.3H2O.

TI The combustibility of foods and their degradation products

AU Kerp, W.

SO Arb. Reichsgesundh. (1926), 57, 545-72

DT Journal
```

LA Unavailable

As comparative investigation of the combustibility of nutritive substances and their biol. important degradation products. The combustibility is expressed by the speed at which the C content could be converted into CO2, the same oxidizing agent being used for all substances, and is calculated in % of the total amount obtainable. An apparatus was constructed which permitted

control of the liberated CO2 at optional time intervals. A mixture of 30% H2O2 and concentrated H2SO4 was used as the oxidizing agent (cf. C. A. 16, 1196). The following carbohydrates were investigated: arabinose, dextrose, levulose, sucrose, lactose, raffinose, starch, cellulose and inulin. All were characterized by a rapid combustion. The total CO2 from 0.15 g. substance was liberated in 35-50 min. The oxidation started at 75-90°, increased rapidly to 100-10°, and reached 120-30° at the end. It is assumed that the di-, tri- and polysaccharides were subject to a rapid hydrolysis into monosaccharides and oxidized as such. The following fats, fatty acids and degradation and oxidation products, resp., were investigated: pressed tallow(I), cottonseed oil(II), glycerol(III), caproic, caprylic, capric, palmitic, stearic, oleic, formic (Na salt) (IV), acetic (Na salt) (V), propionic(VI), oxalic(VII), succinic(VIII), glycolic(IX), lactic(X), dihydroxystearic, and for comparison malic(XI), tartaric(XII) and citric acids(XIII). The combustion of fats and fatty acids started at, about 115°, and the temperature had finally to be increased to 150° with an extra addition of oxidizing agent. I, II and the fatty acids, except IV and V, were almost equal in combustibility. IV was rapidly oxidized and approached the carbohydrates in this respect. V was very resistant, about 65% being oxidized in 5 hrs. against 33.9% on an average for fats and fatty acids. Of the dicarboxylic acids VII was equal in combustibility to IV, while VIII showed the fatty acid type. III was oxidized more slowly than the carbohydrates, but more rapidly than the fatty acids. The hydroxy acids IX, XI XII and XIII were easily oxidized. X was an exception and about equal to VI. The following proteins and degradation products, resp., were investigated: casein(XIV), egg albumin(XV), glycocoll(XVI), alanine, α -aminobutyric and α and δ -aminovaleric acids; leucine, aspartic acid(XVII), $asparagine (XVIII) \,, \,\, tyrosine (XIX) \,, \,\, phenylalanine (XX) \,, \,\, creatine (XXI) \,, \,\, creatinine (XXII) \,, \,\, urea (XXIII) \,\, and \,\, barbituric (XXIV) \,\, and \,\, uric \,\, acids (XXV) \,;$ cystine(XXVI) and benzoic (XXVII), salicylic(XXVIII) and o-, m- and p-aminobenzoic acids(XXIX). The Ncompds. were very. resistant to oxidation, except that XXIX. XIV and XV reached about 50% in 2 hrs. combustibility of the amino acids increased with the number of C atoms. It is concluded that the NH2 group exerts a protective action against oxidation, which is strongest at the vicinal C atoms. A diagram showing this is presented. The protective action of the NH2 group was also apparent with XVIII, XXI, XXII, XXIII and XXVI, XXIV and XXV were considerably more rapidly oxidized because of the easy destruction of the malonic acid in the one case and the mesoxalic acid residue in the other. XIX and XX exhibited a similar action, inasmuch as here the Ph group was the easily oxidized part. This was proved by the ready combustion of XXVII, XXVIII and XXIX. A comparison of V and VIII with the corresponding hydroxy and amino derivs. shows typical examples of the increase in combustibility brought about by the entry of one OH group in the mol. (IX or XI and Xll), while the entry of one NH2 group results in extremely resistant compds. (XVI or XVII). Tables and diagrams showing the progressive combustibility in all expts. are presented.
